Task 2 - Business Summary Report

Date: 18 July 2026

Prepared By: Arya Mohanrao Mandke

Intern ID: MT5993

Batch: 01 July 2026

1.0 Executive Summary

This report provides a comprehensive analysis of the historical sales data for Maincraft. By utilizing advanced SQL queries, Excel Pivot Tables, and a Power BI interactive dashboard, I have extracted key business performance metrics. The goal of this report is to evaluate regional performance, product category profitability, customer segment value, and to provide actionable recommendations for sustained business growth.

2.0 KPI Overview

The overall health of the business is strong, demonstrating solid revenue generation and a healthy baseline profit margin.

- Total Sales Revenue: \$2.26 Million
- Total Profit: \$339.23 Thousand
- Overall Profit Margin: 15.00%
- Total Unique Customers: 793

Note: The 15% profit margin serves as our baseline. Any segment or category falling significantly below this threshold requires strategic review.

3.0 Regional Performance Analysis

Key Question: *Which region generates the highest revenue?*

My geographic analysis reveals a clear dominance on the West Coast.

- The West Region: Leads the company in total revenue, accounting for 31.4% of all sales (approximately \$710.22K).
- The East Region: Follows closely as the second most valuable territory at 29.6% (\$669.52K).

- The South & Central Regions: These regions lag behind, with the South contributing only 17.21% (\$389.15K) and Central at 21.78% (\$492.65K).

Sum of Sales by Region

Insight: The business is heavily reliant on coastal markets. The West and East combined account for over 60% of total revenue.

4.0 Category Performance & Profitability

Key Questions: *Which category has the highest profit margin? Are discounts reducing profitability?*

While top-line revenue is important, bottom-line profitability tells the true story of category health.

- Technology (Top Performer): Technology is the definitive profit driver for the company. It generates the highest absolute profit by a wide margin, proving to be the most cost-efficient and lucrative category.
- Office Supplies (Stable): Maintains a steady and predictable profit margin, acting as the consistent backbone of daily sales.
- Furniture (Underperforming): Despite driving a massive volume of raw sales, the Furniture category yields remarkably low profit.

Sum of Profit by Category

Insight on Discounts: The stark contrast between high sales and low profit in the Furniture category strongly indicates an over-reliance on aggressive discounting. To move bulky inventory, the company is likely applying steep discounts that heavily erode, and sometimes negate, the profit margin.

5.0 Customer & Segment Analysis

Key Question: *Which customer segment is most valuable?*

Maincraft serves three primary segments: Consumer, Corporate, and Home Office.

- **Consumer Dominance:** The Consumer segment is the absolute core of the business, generating 50.76% of total revenue (approximately \$1.15 Million).
- **Corporate:** Accounts for 30.44% (\$690K) of sales.
- **Home Office:** The smallest segment at 18.79% (\$420K).

Sum of Sales by Segment

Top Customers: Our Pareto analysis of the 793 unique buyers shows that a small fraction of individuals (such as Sean Miller, Tamara Chand, and Raymond Buch) consistently place high-value orders, driving a disproportionate amount of revenue.

Sum of Sales by Customer Name

6.0 Temporal and Seasonal Trends

Key Question: *Is there a seasonal sales trend?*

Historical time-series data from 2015 to 2018 highlight a clear growth trajectory.

- **Macro Trend:** After a slight revenue dip in 2016, the company experienced aggressive,

exponential growth through 2017 and 2018, peaking at over \$722K in annual sales.

- **Seasonality:** Granular time analysis indicates strong seasonal surges in Q4 (specifically November and December), aligning perfectly with holiday shopping and end-of-year corporate budget spending.

Sum of Sales by Year

7.0 Recommendations for Business Growth

Based on the data extracted from the BI dashboard, I recommend the following strategic initiatives to optimize future performance:

1. **Overhaul the Furniture Discount Strategy:** Implement a strict cap on maximum allowable discounts for Furniture items. If an item cannot be sold without a margin-destroying discount, management must evaluate alternative supply chain options or phase out underperforming sub-categories.
2. **Targeted Corporate Expansion:** While the Consumer segment is thriving, the Corporate segment (30%) represents a massive untapped B2B growth opportunity. Introduce bulk-purchasing incentives to drive Corporate sales closer to a 40% revenue share.
3. **Invest heavily in the West/East, while auditing the South:** Allocate the majority of the Q4 marketing budget to our proven markets (West and East). Concurrently, conduct a localized market research study in the South to determine why sales are stagnating (e.g., lack of brand awareness, stronger local competitors).
4. **Implement a VIP Customer Loyalty Program:** Given that top customers like Sean Miller and Tamara Chand drive significant revenue, create a dedicated VIP tier. Offer them early access to Technology product drops and dedicated account managers to ensure high retention rates for our most valuable assets.

8.0 Business Question Answers

1. Which region generates the highest revenue?

The **West** region generates the highest revenue. According to the donut chart, it accounts for **31.4%** of total sales (approximately 710K), closely followed by the East region.

2. Which category has the highest profit margin?

Technology is the most profitable category. Looking at the "Sum of Profit by Category" bar chart, Technology significantly outpaces the others in absolute profit, while Furniture yields very little profit despite having high sales volume.

3. Are discounts reducing profitability?

While I didn't explicitly map discounts on the dashboard, the answer is almost certainly **yes**, particularly in the Furniture category. Furniture generates massive sales but barely breaks even on profit. In retail datasets, this usually indicates that heavy discounts are being used to move inventory, which eats directly into the profit margin.

4. Which customer segment is most valuable?

The **Consumer** segment is by far the most valuable. The pie chart shows it drives over half of the entire business revenue (**50.76%**, or roughly 1.15M in sales), making it twice as large as the Corporate segment.

5. Is there a seasonal sales trend?

The line chart currently displays a yearly trend, showing a slight dip in 2016 before growing exponentially through 2018. Massive spikes in sales during Q4 (November/December) for the holiday shopping season can be seen!
